- Some issues of “classical” DRT
- Some remarks about discourse representation and interpretation
- Fine-grained and coarse-grained theories
- ontological granularity
- propositional granularity
- outlook: textual granularity

## Some Issues of “classical” DRT

- Quantification and the reference of pronouns

(1) *Every farmer who owns a donkey beats it.*

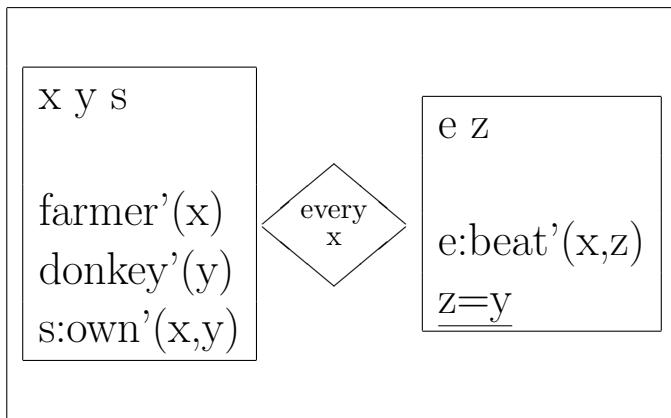

The diagram illustrates the logical form of the sentence. It starts with the sentence: "Every farmer who owns a donkey beats it." A bracket underlines the entire sentence. Three arrows point from this bracket to the corresponding parts of the logical expression: "Every" points to the quantifier  $\forall x$ ; "farmer who owns a donkey" points to the predicate  $farmer'(x) \wedge \exists y (donkey'(y) \wedge own'(x, y))$ ; and "beats it" points to the predicate  $beat'(x, ?z)$ .

$$\forall x(farmer'(x) \wedge \exists y(donkey'(y) \wedge own'(x, y))) \rightarrow beat'(x, ?z))$$

problem: PL-quantifier scope & compositionality

↔ accessibility in hierarchically structured representations

(Kamp 81)

## Some Issues of “classical” DRT

- (Temporal) links between the sentences of a discourse

(2) *Vite, docteur, dépêchez-vous. Mon mari a pris deux cachets d'aspirine, il a avalé sa lotion contre les aigreurs d'estomac, il s'est mis un suppositoire contre la grippe, il a pris un comprimé à cause de son asthme, il s'est mis des gouttes dans le nez, et puis il a allumé une cigarette. Et alors, il y a eu une enorme explosion.*

(Kamp Rohrer 83)

$$\begin{aligned} S_1 &\rightsquigarrow P(\exists x(\text{deux\_cachets}'(x) \wedge \text{mon\_mari}'(a) \wedge \text{prendre}'(a, x))) \\ S_2 &\rightsquigarrow P(\text{avaler}(a, b) \wedge \text{lotion}'(b)) \\ \vdots &\qquad\qquad\vdots \end{aligned}$$

$$|[T]| = |[S_1]| \cap |[S_2]| \cap \dots \cap |[S_n]|$$

problem: truth of the text is independent on the order of the sentences

$\rightsquigarrow$  the sentence completes the (preceding) context.

sp a e1 x e2 b e3 y ... e7 z
mari(a,sp)
deux_cachets'(x)
e1:prendre(a,x)
lotion'(b)
e2:avaler(a,b)
suppositoire'(y)
e3:se_mettre(a,y)
:
:
e7:exploser(a)
<u>e1 &lt; e2 &lt; e3 &lt; ... &lt; e7</u>

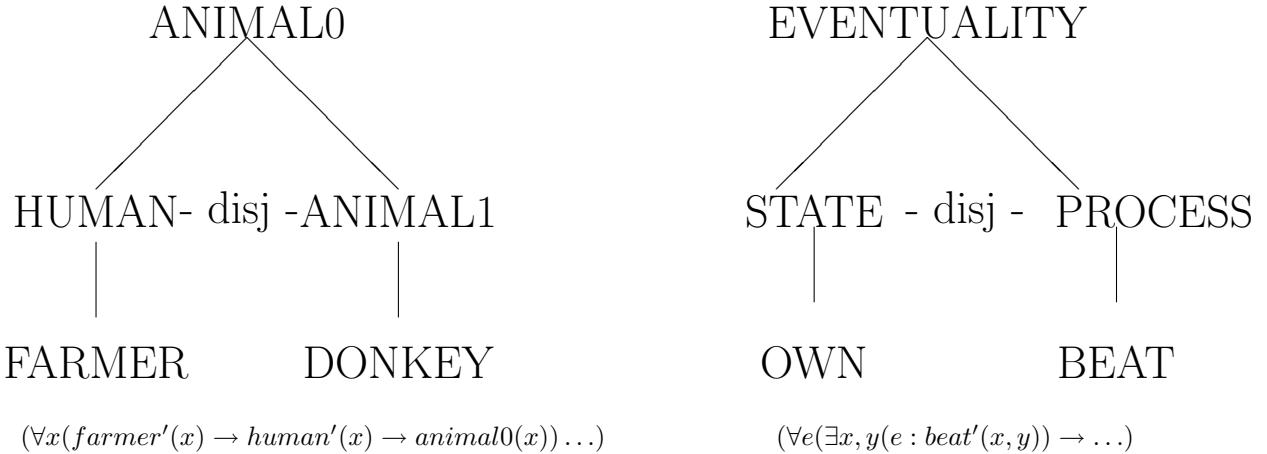

## Discourse Representations I

W.r.t. the structural phenomena exemplified by (1) and (2), it is appropriate:

- to analyze lexical items into basic predicates
- 

farmer	$\lambda x.\text{farmer}'(x)$
donkey	$\lambda x.\text{donkey}'(x)$
own	$\lambda y,x,s. s:\text{own}'(x,y)$
beat	$\lambda y,x,e. e:\text{beat}'(x,y)$

possibly (but not necessarily) interrelated by sortal/implicational links:

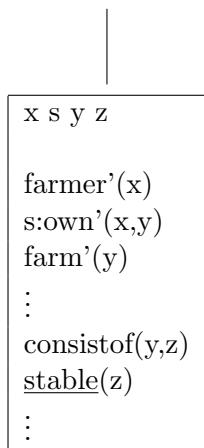

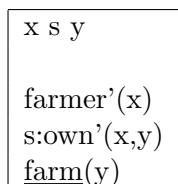

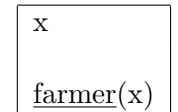

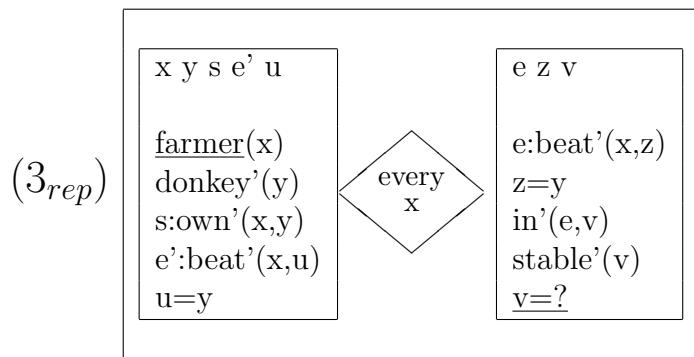

- to analyze tense/aspect information into simple temporal relations
- 

passé simple - passé simple	into	$\prec$
passé simple - imparfait	into	$= (\emptyset, \subseteq)$

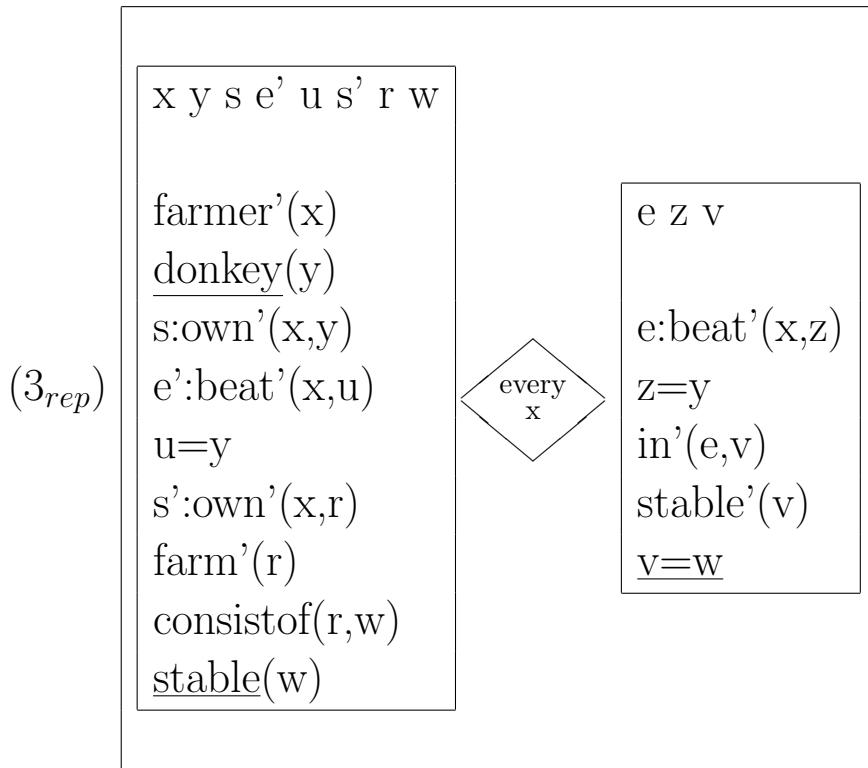

## Discourse Representations II

The scenario is different, in case there is more material / the fragment is richer:

- (3) *Every farmer who owns a donkey and beats it beats it in the stable.*

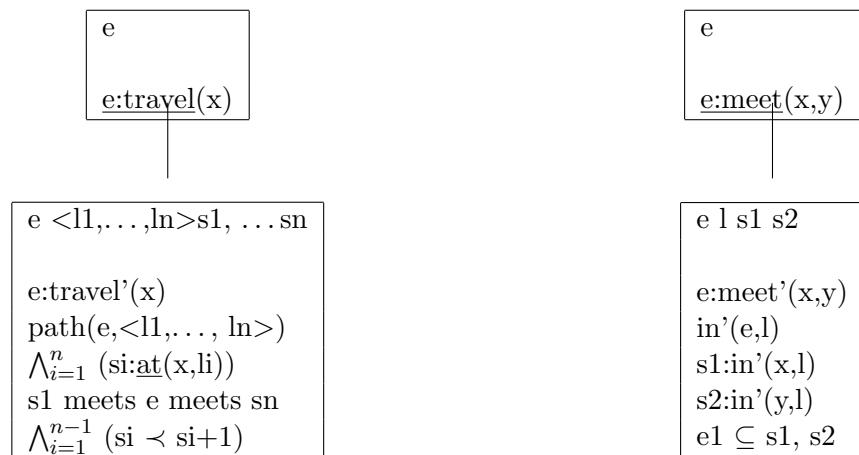

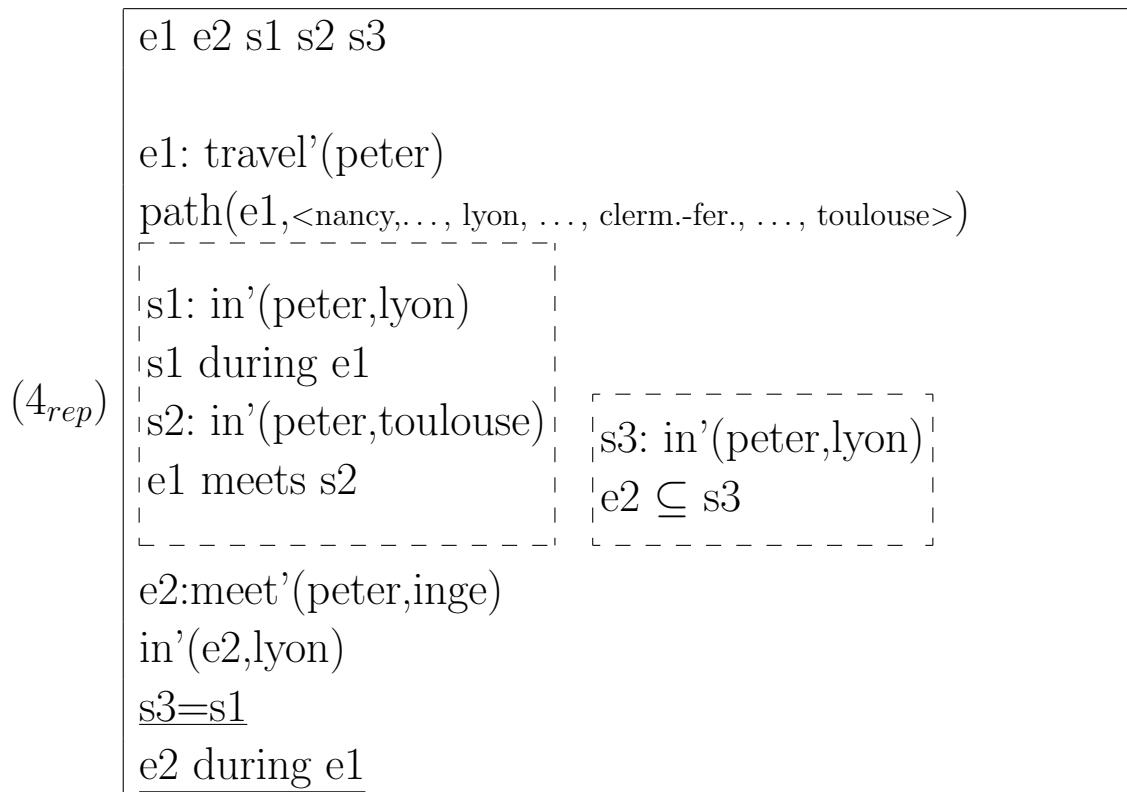

## Discourse Representations III

## Discourse Representations IV

The fragment allows for other discourse relations:

- (4) *Peter travelled from Nancy to Toulouse via Lyon et Clermond-Ferrand. In Lyon he met Inge.*

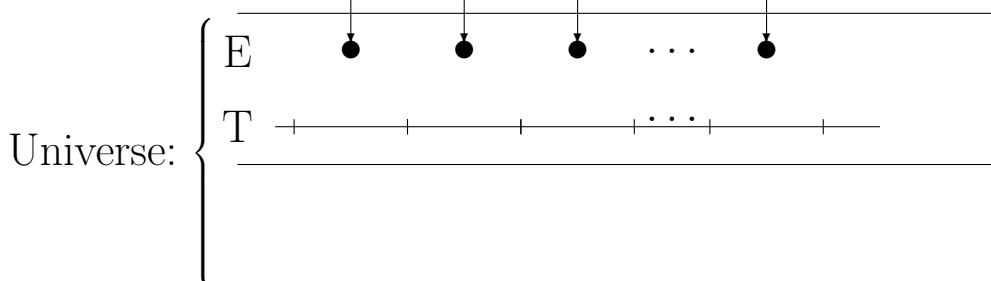

## Discourse Interpretations I

For

$(2_{rep})$	sp a e1 x e2 b e3 y ... e7 z  mari'(a,sp)  deux_cachets'(x) <u>e1:prendre(a,x)</u>  lotion'(b) <u>e2::avaler(a,b)</u>  suppositoire'(y) <u>e3:se_mettre(a,y)</u> $\vdots$ $\vdots$ <u>e7:exploser(a)</u>  $e1 \prec e2 \prec e3 \prec \dots \prec e7$
-------------	---

we can do with interpretations:

the vocabulary of  
point structures:       $=$  ,  $<$

...that satisfy to the **theory of point structures**  $\Phi_{\leq}^p$ .

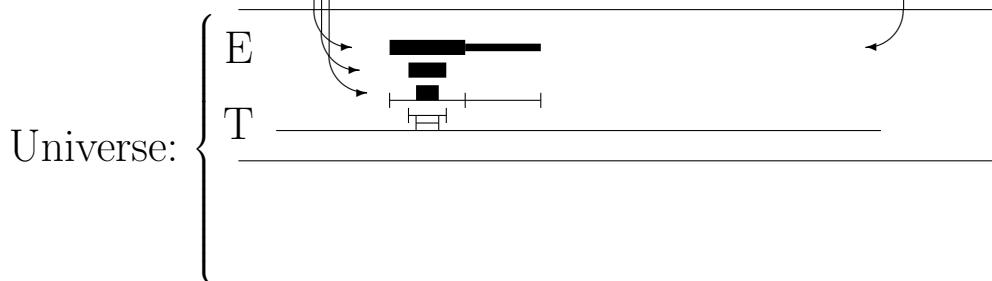

## Discourse Interpretations II

For

e1 e2 s1 s2 s3

$e1: \text{travel}'(\text{peter})$   
 $\text{path}(e1, <\text{nancy}, \dots, \text{lyon}, \dots, \text{clerm.-fer.}, \dots, \text{toulouse}>)$   
 $s1: \text{in}'(\text{peter}, \text{lyon})$   
 $s1 \text{ during } e1$   
 $(4_{rep})$   
 $s2: \text{in}'(\text{peter}, \text{toulouse})$   
 $e1 \text{ meets } s2$   
 $e2: \text{meet}'(\text{peter}, \text{inge})$   
 $\text{in}'(e2, \text{lyon}) \quad e2 \subseteq s3$   
 $s3: \text{in}'(\text{peter}, \text{lyon})$   
 $s3 = s1$   
 $e2 \text{ during } e1$

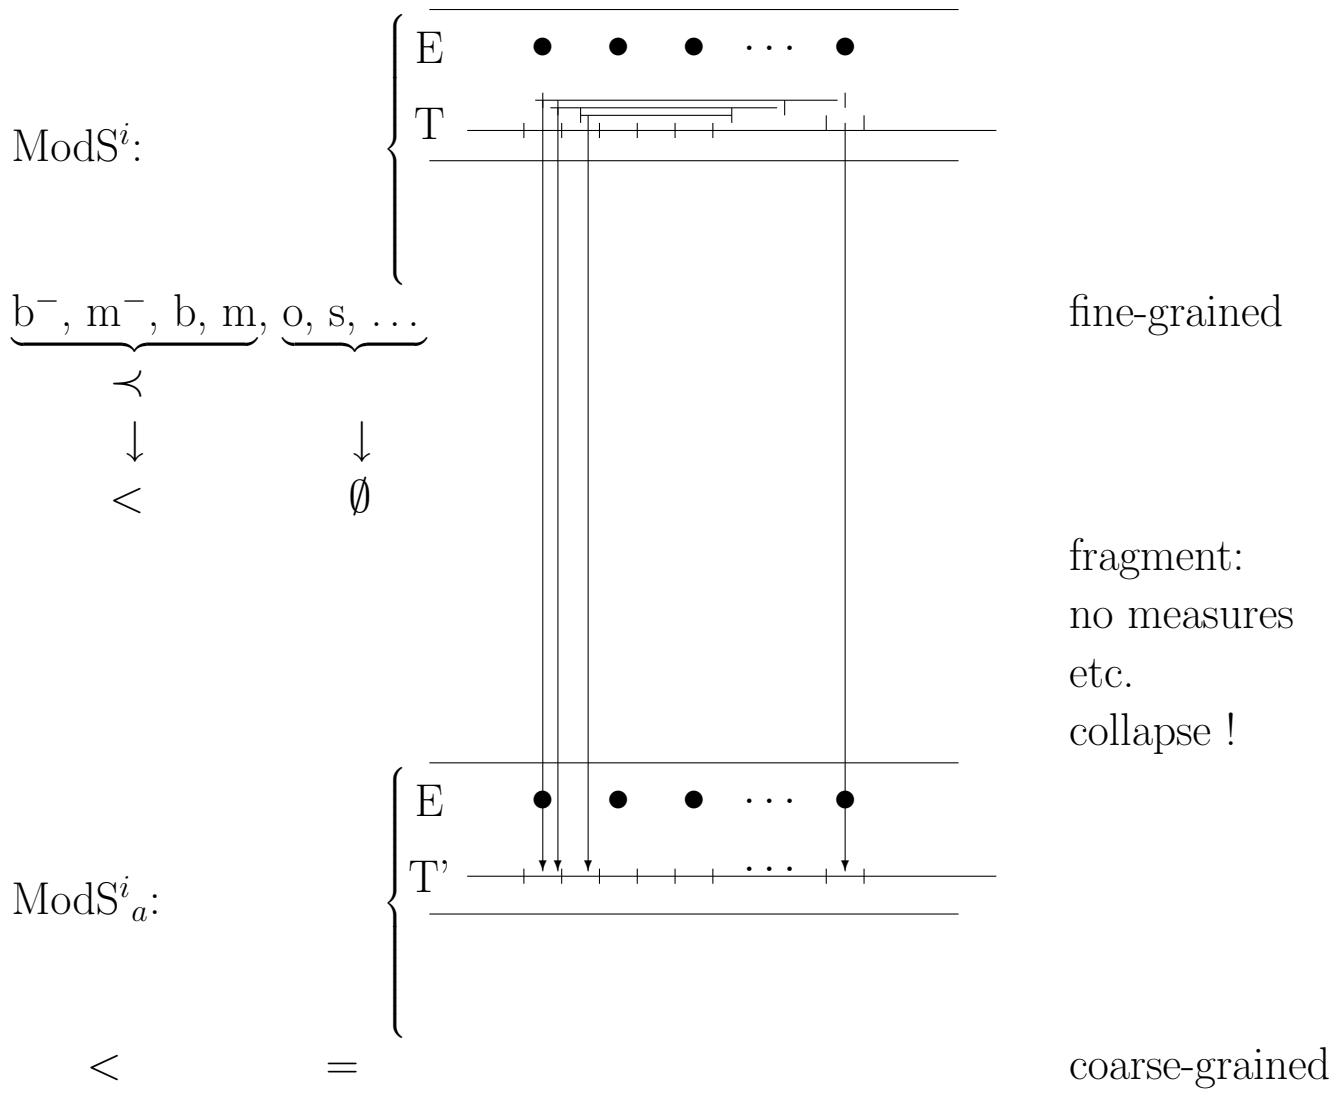

we need interpretations:

the vocabulary of  
interval structures: b, m, o, s, d, ...

... that satisfy to the **theory of interval structures**  $\Phi_{b,m,o,s,d,\dots}^i$ .

## Discourse Interpretations III

advantage: transitive closure

fine-grained theory:  $\Phi_{b,m,s,\dots}^i + \text{DB} \models i \text{ R } j$  NP-complete  
 coarse-grained theory:  $\Phi_{=,<}^p + \text{DB} \models t \text{ R' } t'$  polynomial

In case we know that the fragment is such that all events that overlap only trivially overlap, in the sense that, in this case, they refer to the same time, we can collapse a fine-grained model (for interpreting (all kinds of) interval statements) in a more coarse-grained model that will do for interpreting the texts of the fragment; for instance by choosing a (discrete) suborder (the times of the considered events) and by mapping every interval to the first of this sequence that it overlaps with.

## Fine-grained and Coarse-grained Theories

- Jerry Hobbs: *Granularity* (1985)

- fine-grained complex theory      coarse-grained simple theory

$$T_{0|over P_1, \dots, P_m, \dots, P_n} \xrightarrow{k} T_{1|over k(P_1), \dots, k(P_m)}$$

domain:

$S_0$   
 $x_1, x_2, x_3, \dots$

$S_1$

$x_i \sim x_j \leftrightarrow \forall 1 \leq r \leq i (P_r(x_i) \leftrightarrow P_r(x_j))$   
 ("indistinguishable" w.r.t.  $P_1, \dots, P_I$ )

$$k(x_i) = k(x_j) \leftrightarrow x \sim x_j$$

$$k(x_1), k(x_4), \dots$$

complex world with  
 different objects, agents ...

the schematic simple  
 blocks world

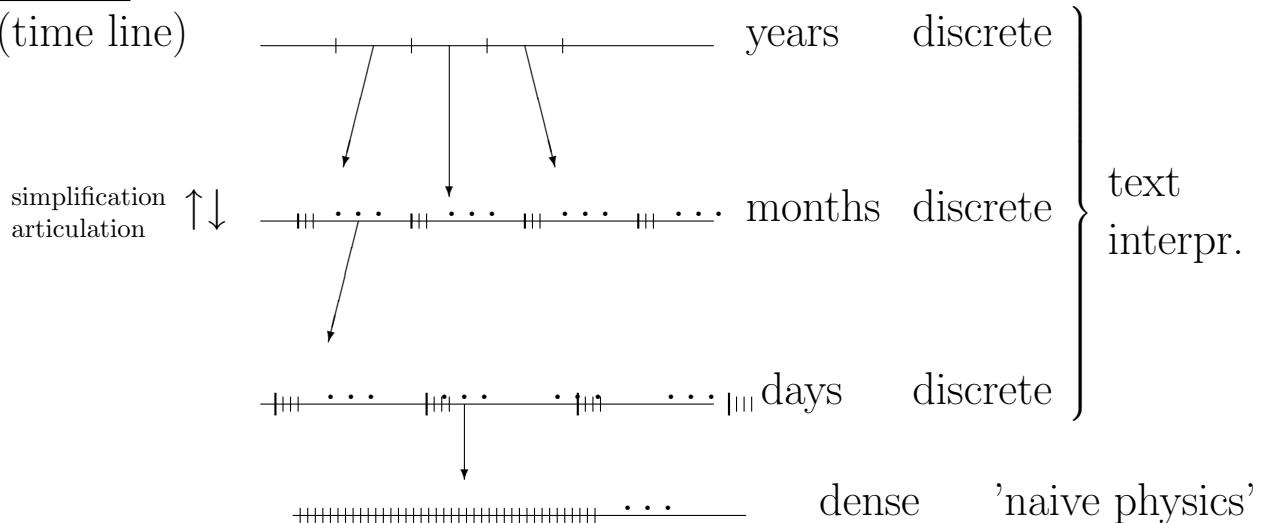

*simplification*  
 $\overleftarrow{\overrightarrow{}}$   
*articulation*

## Ontological Granularity - Examples

(Text model simpler than 'naive physics' model)

calendar:

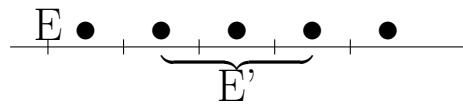

(time line)

homogeneity of event types:

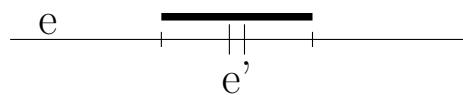

coarse-grained perspective

$$\lambda E. ( E \ iter \ e \boxed{e \\ e:\text{go\_to\_school}(peter)} )$$

fine-grained perspective

$$\lambda e. \boxed{e \\ e:\text{sleep}(peter)}$$

## Ontological Granularity - Examples

(Text model simpler than 'naive physics' model)

paths

*Peter travelled from Germany to France.*

```
e
e:travel(peter)
path(e,<germany,france>)
```

*Peter travelled from Kaiserslautern to Toulouse via ...*

```
e
e:travel(peter)
path(e,<kaiserslautern,\dots,lyon,\dots,toulouse>)
```

**more specific path:**

$\forall w, w' \in WEG$

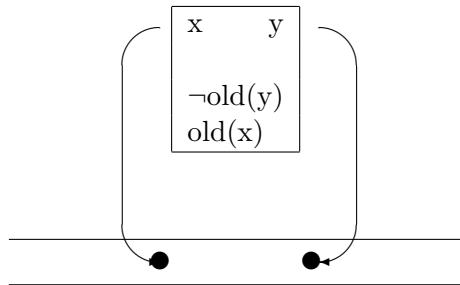

$$\begin{aligned} (w \leq^s w' \leftrightarrow & [hproj_1(w) \leq_f hproj_1(w') \wedge hproj_{weite(w)}(w) \leq_f hproj_{weite(w')}(w') \\ \wedge (\forall j \in \mathbb{N} \quad & (1 < j < weite(w') \\ \rightarrow & \exists i \in \mathbb{N} \quad (1 \leq i \leq weite(w) \wedge hproj_i(w) \leq_f hproj_j(w'))))) \\ \wedge (\forall i, j \in \mathbb{N} \quad & (1 \leq i < weite(w) \wedge 1 \leq j < weite(w') \wedge hproj_i(w) \leq_f hproj_j(w') \\ \rightarrow & hproj_{i+1}(w) \leq_f hproj_j(w') \vee hproj_{i+1}(w) \leq_f hproj_{j+1}(w'))]))] \end{aligned}$$

## Ontological Granularity - Examples

('naive physics' model simpler than text model)

*The ring is not old, but the gold that makes up the ring is old.*  
 (Link 83)

object  
+  
substance

text model

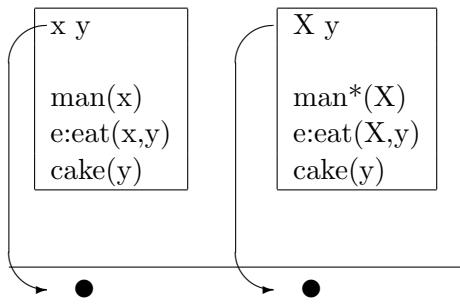

f

'naive physics'

*The man ate the cake / the men ate the cake*

plural

text model

{...}

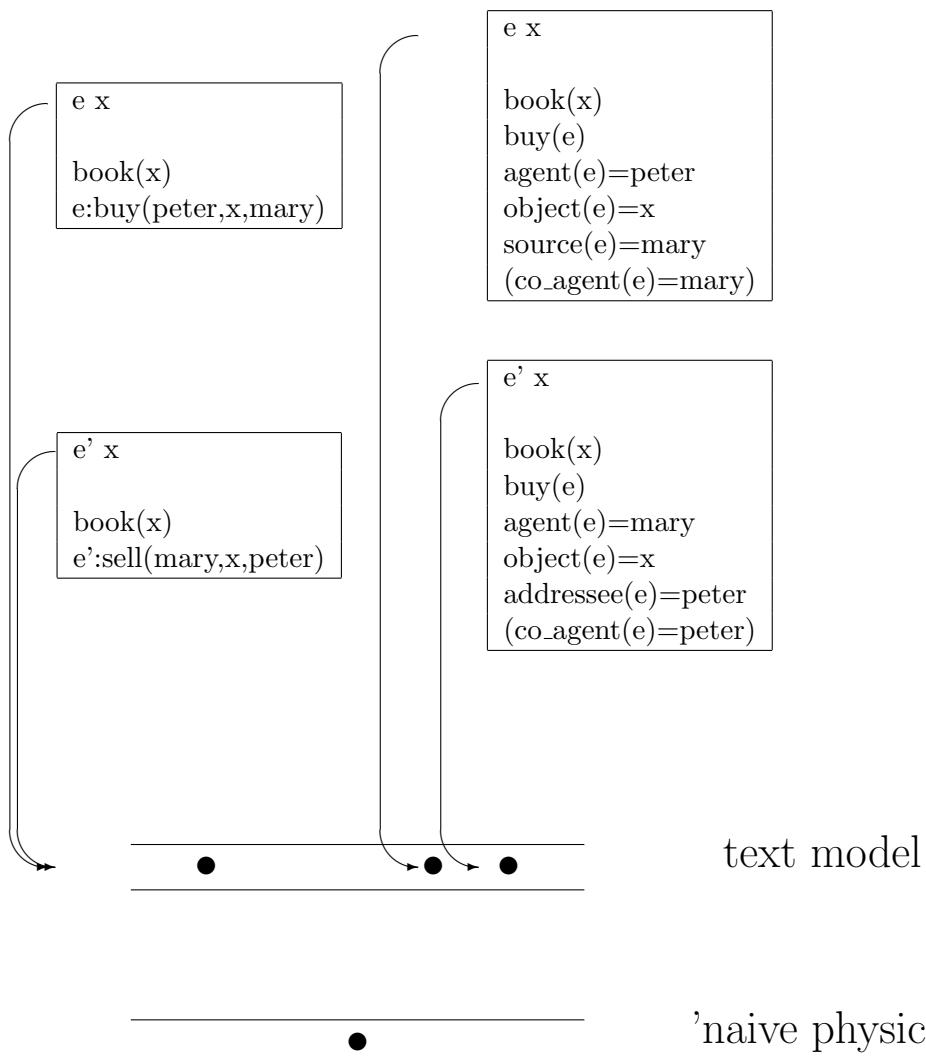

'naive physics'

## Ontological Granularity - Examples

('naive physics' model simpler than text model)  
influence of the representation format

- (5) *Peter bought the book from Mary.*  
*Mary sold the book to Peter.*

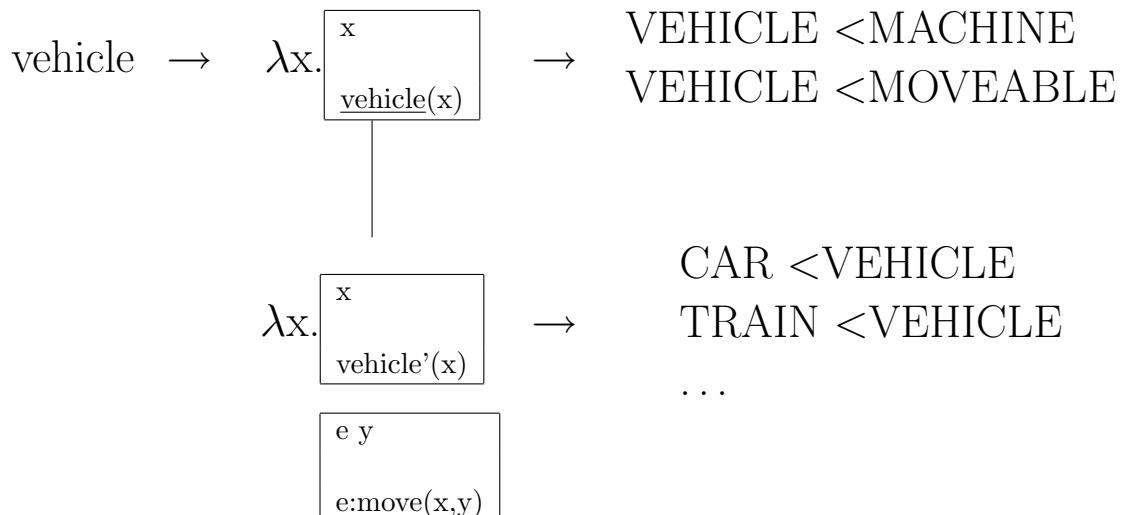

Strategy: Keep the theory and interpreting structures as simple as appropriate

→ transition to a more fine-grained level only when needed.

What does this mean?

- the text system should not be backed by an overall available fine-grained theory
- the text elements
  - i) define their level of granularity;  
i.e. relate themselves to the relevant characterizations of this level
  - ii) define their specific contribution to articulation

example:

## Propositional Granularity

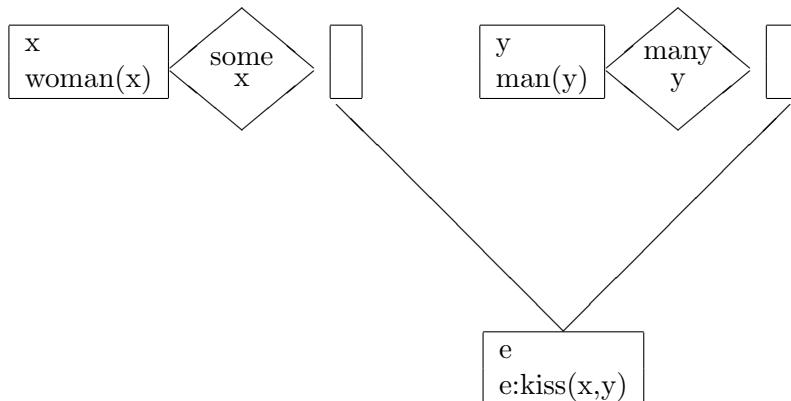

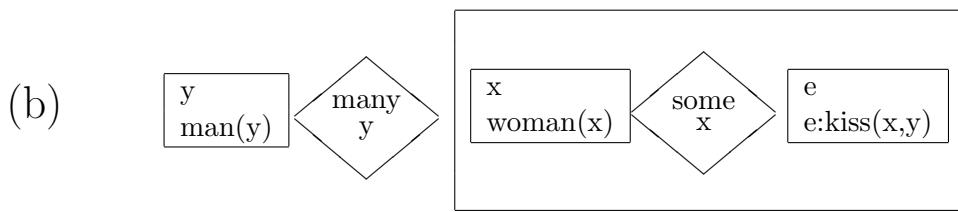

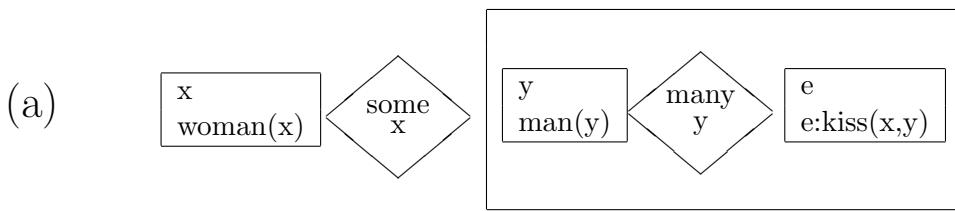

- The lexicon specifies (parts of) the relevant theory
- The text - via composition - defines a database and theory of a certain granularity
- Two sources of granularity:
  - variable depth of the analysis of lexical items
  - variable depth of the analysis of the interplay between the lexical contributions in the sentence  
(between the sentences in the text)  
→ w.r.t. the interplay of quantificational (and other scope bearing) expressions:  
underspecified DRT (UDRT -Reyle)

## Propositional Granularity - Examples

UDRT

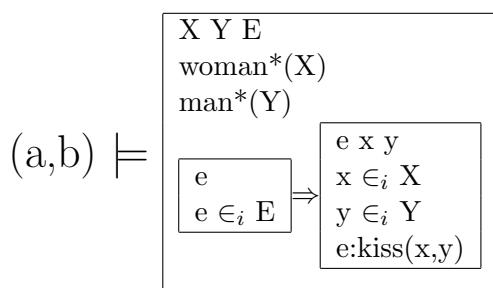

- (6) *Vielen Männern gaben einige Frauen einen Kuss.*

Many men were kissed by some women.

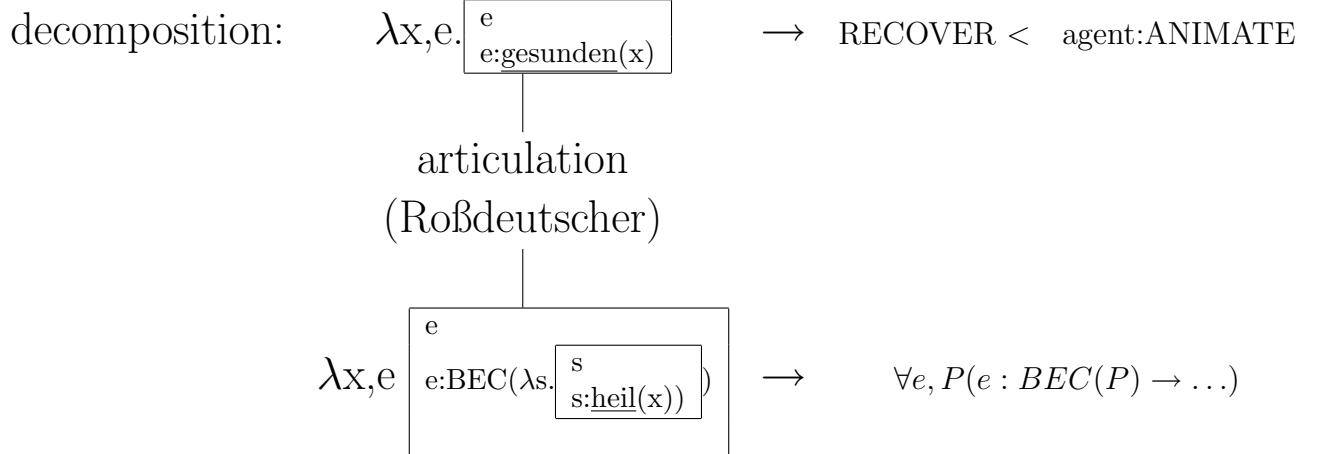

(a,b)

- ↔ (claim:) psychologically motivated level of abstraction  
 ↔ legitimates the outlining of  
 a logic for the ambiguity preserving representation format

## Propositional Granularity - Examples

### Lexical Analyses

problems:

generic term

vs.

ambiguity

$$\lambda x. \boxed{x \\ \text{vehicle}(x)}$$

$$\lambda x. \boxed{x \\ \text{bank}_{\text{german}}(x)}$$

$$\lambda x. \boxed{x \\ \text{car}(x)}$$

$$\lambda x. \boxed{x \\ \text{train}(x)}$$

...

$$\lambda x. \boxed{x \\ \text{bank}(x)}$$

$$\lambda x. \boxed{x \\ \text{bench}(x)}$$

...

Peter has no vehicle

Peter sucht keine Bank

~no car, no bicycle ...

Peter doesn't look for a bank

or

Peter doesn't look for a bench

→ context dependence

(local vs. global evaluation of the analytic disjunction)

## Propositional Granularity - Examples

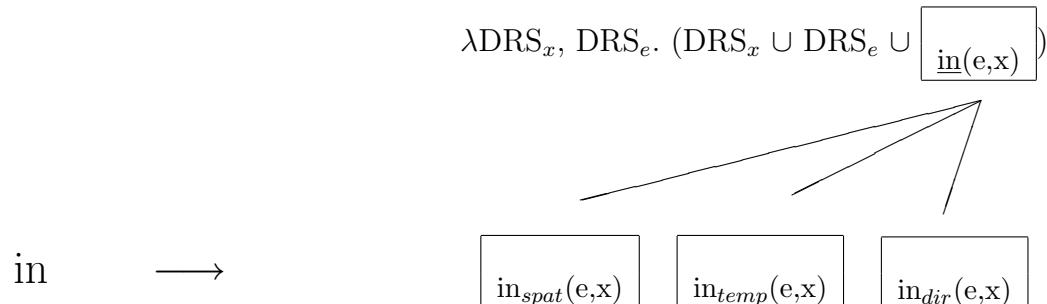

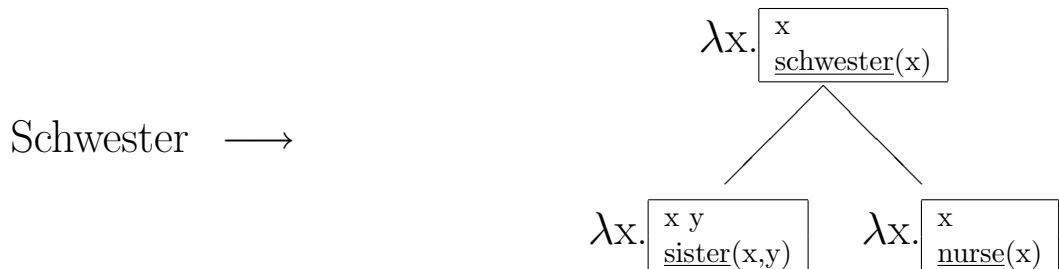

correlated ambiguities (Reyle)

Peter sucht eine Bank<sub>1, bank / 2, bench</sub>, findet aber keine<sub>1, bank / 2, bench</sub>.

Many men<sub>wide/narrow</sub> were kissed by some women<sub>narrow/wide</sub> and  
many dogs<sub>wide/narrow</sub> were given a bone by some cooks<sub>narrow/wide</sub>.

## Propositional Granularity - Examples

problem: diverging representational format of the different meanings

the flower in the vase / the money in the pocket / the hole in the wall

- für →
- Für einen Buchhalter hat er verbissen gekämpft.  
 He furiously struggled for a book-keeper.
- He simply liked him → beneficiary
  - He simply needed one → causa finalis
  - However the other book-keepers thought  
 that the man could have done better  
 →perspective
  - As far as book-keepers struggle furiously  
 →aspect

*Für einen Buchhalter hat er verbissen gekämpft.*

a) for the benefit of a book-keeper

$x_{pro} e y$   
 e:struggle(x)  
 beneficiary(e)=y  
 book-keeper(y)

b) in order to obtain a book-keeper

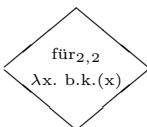

$x_{pro} e p$   
 e:struggle(x)  
 causa\_finalis(e,p)  
 y  
 p: book-keeper(y)  
 R(x,y)

a), b) → existential reading of the external argument

c) from the perspective of a (specific) book-keeper

y  
 book-keeper(y)  
  
 für<sub>2,1</sub> y       $x_{pro} e$   
 e:struggle(x)

d) compared to the repertoire of book-keepers

  
 für<sub>2,2</sub> λx. b.k.(x)       $x_{pro} e$   
 e:struggle(x)

c), d) → relativized characterization of the world

## Correlated Ambiguities

*Für einen Buchhalter hat er verbissen gekämpft.*

He furiously struggled for a book-keeper.

*Für einen Sekretär hat er keinen Finger gerührt.*

For a secretary, he did not lift a finger.

Representation:

$$\lambda \text{DRS}_x, \text{DRS}_e. \boxed{\underline{\text{für}}(\text{DRS}_x, \text{DRS}_e)} \rightarrow \text{logic ?}$$

$$\boxed{\begin{array}{c} \diamond \\ \swarrow \quad \searrow \\ \underline{\text{für}}_2(\text{DRS}_x) \end{array}} \text{DRS}_e \rightarrow \begin{array}{l} \text{modal, epistemic logic} \\ \text{s:att(x, } \{ \text{ <BEL, } \square \text{ > } \}) \end{array}$$

$$\text{DRS}_e \cup \boxed{\underline{\text{für}}_1(e, \text{DRS}_x)} \rightarrow \begin{array}{l} \text{deontic logic} \\ \text{s:att(agent(e), } \{ \text{ <DESIRE, } \square \text{ > } \}) \end{array}$$

Realization:

**Macros:** hierarchically specify lexical entries:

- prepsem(für,flat)
- prepsem(für,rel;modop)
- prepsem(für,rel(ext(benf);int(causfin));modop(asp;persp))

define CUF-sorts (Categorial unification formalism):

$$\begin{aligned}\underline{\text{für}}(\text{DRS}_x, \text{DRS}_e) &:= \text{merge}(\text{DRS}_e, \underline{\text{für}}_1(e, \text{DRS}_x)) \\ &:= \left( \begin{array}{l} \text{modop: } \underline{\text{für}}_2(\text{DRS}_x) \ \& \\ \text{modarg: } \text{DRS}_e \end{array} \right)\end{aligned}$$

**evaluation:** controlled by **wait**-statements

- wait( $\underline{\text{für}}(\_, \text{DRS}_{e_{agentive}}) \rightarrow \_$ ).  
wait( $\underline{\text{für}}(\_, \text{DRS}_{e_{nonagentive}}) \rightarrow \_$ ).
- quantifier ?  $\rightsquigarrow$  perspective: possible / aspect: not possible
- information structure

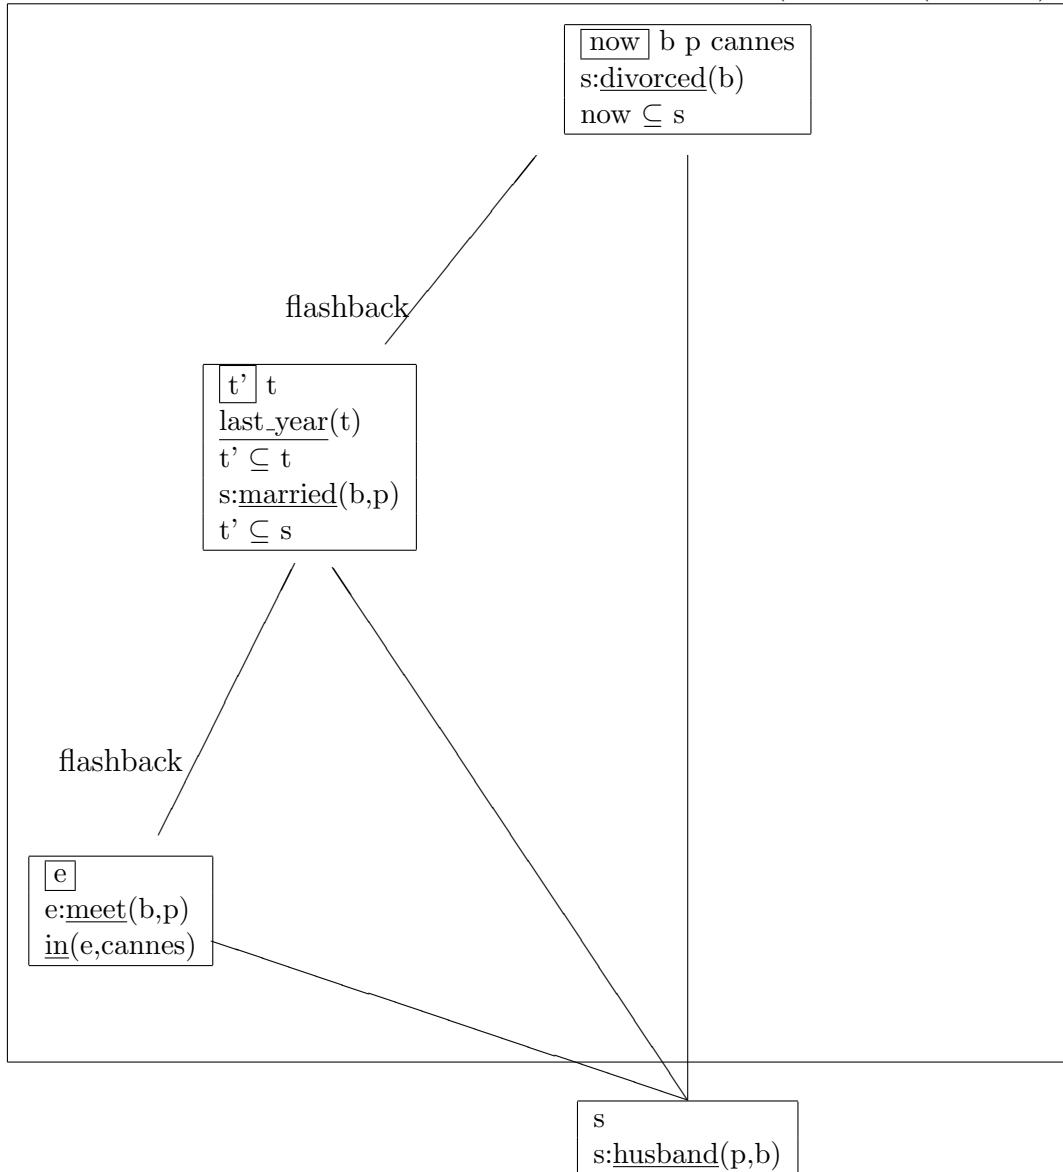

## Outlook: Textual Granularity

- (7) *Mme B. ist geschieden. Noch letztes Jahr war sie allerdings verheiratet, mit Pierre E. Sie hatte ihren Mann in Cannes kennengelernt.*

Mme B. is divorced. However, last year she still was married - to Pierre E. She had met her husband in Cannes.

$\rightsquigarrow$  the meeting  $\not\equiv$  Pierre is her husband

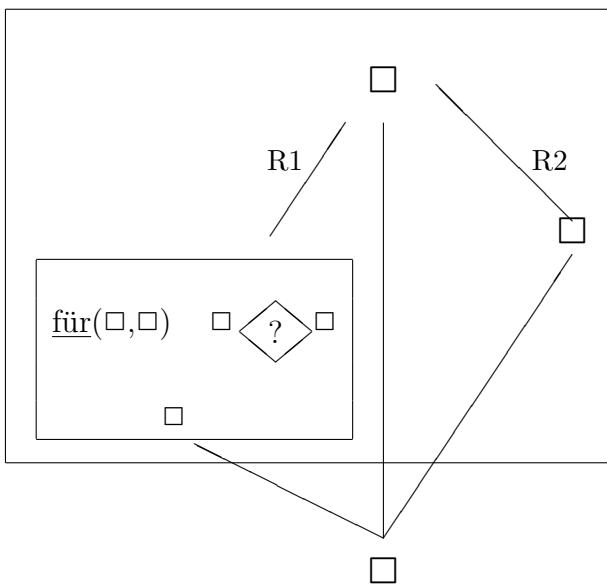

$\rightsquigarrow$  underspecify text representations: (SDRT (Asher)  $\rightarrow$  uSDRT)

## Summary

Suggestion: two step analysis

- 0) the background theory (specific to the scenario)  
distributed over the lexicon
- 1) composition:  
flat underspecified text representation  
~> partial DRSs linked to each other
  - links can be refined
  - partial DRSs (conditions) can be expanded

- 2) inspection routine:
  - infers constraints (refine links)
  - triggers articulation, if needed (expand DRSs)

(The two steps might be interleaved)

|| the sentence completes the context and  
triggers articulation of the  
context theory and database
